

Thought Note

On

Website for My Restaurant

1)- First I created a home Page file with a name index.html which contains 3 buttons -Our Menu, Contact Us, and About Us with hovering effect.

When you move your mouse over a button, it changes color to give feedback. In summary, this program creates a basic webpage with buttons for a restaurant. It uses CSS to make it look nice and responsive. To make a full website, I also created separate pages for menu, contact information, and about us, and add content to them as shown details below: -

2)-After the main page I created a webpage displaying a menu, divided into breakfast and lunch sections, along with food item descriptions and images. Here are some thoughts on the code:

containing different type of food images inserted in them and then I arranged the page images with the help of grid property.

I have also applied hovering effect and transition effect on the name of the image buttons so that they look more beautiful.

3)- During building menu I have learned about transition, well at first, I go through many difficulties but still I have done it with success.

4)-Then I created an About Us page which consists of information related to my restaurant site.

And I have also included linear-gradient property for my background.

5)-Then I created a Contact Us page by using the form tag and giving the input like name, email, phone number, etc. We can add more on the contact us page and at last I have created a button to submit this form.

The page has a pleasant color scheme and layout. The title ("About Us") is centered and stands out due to its styling. The use of paragraphs and spacing makes the content easy

to read. The horizontal lines help separate different sections of the content.
